

HUBUNGAN PERSEPSI PERAWAT TENTANG SUPERVISI DENGAN TINDAKAN PENCEGAHAN DAN PENGENDALIAN INFEKSI DI RUMAH SAKIT HASANAH GRAHA AFIAH DEPOK

Nita Caroline Margaretha Pardede

Abstrak

Pencegahan dan pengendalian infeksi bertujuan untuk mencegah dan mengurangi infeksi di layanan kesehatan. Hasil studi pendahuluan ditemukan hambatan dalam pelaksanaan supervisi disebabkan oleh IPCN yang tidak penuh waktu, mutasi, dan kurangnya keyakinan perawat dalam mencuci tangan dan mematuhi SOP karena beban kerja dan banyaknya pasien. Penelitian ini bertujuan mengetahui hubungan karakteristik dan persepsi perawat tentang supervisi dengan tindakan pencegahan dan pengendalian infeksi di RS HGA Depok. Metode penelitian ini menggunakan metode deskriptif analitik dan pendekatan cross sectional dengan total sampling sebanyak 71 responden. Hasil uji chi square menunjukkan hubungan signifikan antara persepsi perawat tentang supervisi dan tindakan PPI (p -value= 0.006; CI 95%; OR 4,364). Supervisi terbukti penting dalam meningkatkan kinerja perawat dalam pencegahan dan pengendalian infeksi. Pihak manajemen rumah sakit perlu melaksanakan supervisi secara rutin agar pelaksanaan Pencegahan dan Pengendalian Infeksi menjadi hal yang terbiasa bagi setiap perawat serta dapat menunjang kondisi dan keselamatan pasien yang lebih prima.

THE RELATIONSHIP OF NURSES PERCEPTIONS ABOUT SUPERVISION WITH INFECTION PREVENTION AND CONTROL MEASURES AT HASANAH GRAHA AFIAH DEPOK HOSPITAL

Nita Caroline Margaretha Pardede

Abstract

Infection prevention and control is aimed at preventing and reducing infection in healthcare. Preliminary studies found obstacles to supervision due to the lack of full-time IPCN, mutations, and lack of confidence of nurses in handwashing and compliance with SOPs because of the workload and number of patients. The study aims to find out the relationship between the characteristics and perceptions of nurses about supervision and prevention and control of infections at Depok HGA Hospital. The research method uses descriptive analytical methods and cross sectional approaches with a total sampling of 71 respondents. The results of the chi square test showed a significant relationship between nurses perceptions of supervision and PPI action (p -value=0.006; CI 95%; OR 4.364). Supervision has proved important in improving the performance of nurses in the prevention and control of infections. Hospital management needs to carry out routine supervision so that the implementation of Infection Prevention and Control becomes a routine for every nurse and can maintain a better condition and safety of patients.
