**CHARACTERISTICS AND MANAGEMENT OF PITYRIASIS
VERSICOLOR PATIENTS IN FATMAWATI
GENERAL HOSPITALS YEAR 2015-2017**

Tri Satria Wibawa

Abstract

Pityriasis versicolor is a superficial fungal infection characterized by macules in the skin, thin squama followed by itching sensation due to colonization of the stratum corneum by dimorphic lipophilic fungal from the normal flora of the skin. This study aims to describe the characteristics and management of Pityriasis versicolor patients at Fatmawati General Hospital in 2015-2017. This study was conducted with retrospective descriptive method based on medical record data with *cross sectional* approach and *total sampling* technique. Out of 178 cases of Pityriasis versicolor, 110 patients (61,8%) were male, 59 patients (33,1%) had aged range 25-44 years, 70 patients (39,3%) were student, 140 patients (78,7%) had hypopigmented lesion, 63 patients (35,4%) had lesion on the trunk, 107 patients (60,1%) had lesion during non-rainy season. Compliances of the treatment received in 151 patients (84,8%). Topical and oral treatment were given together in 115 patients (64,6%). Patients who came to Fatmawati General Hospital in 2015-2017 have diverse characteristics from age, gender, occupation, color of lesion, location of lesion, season, compliances of the treatment, and combination therapy due to widely spread of the lesion.
